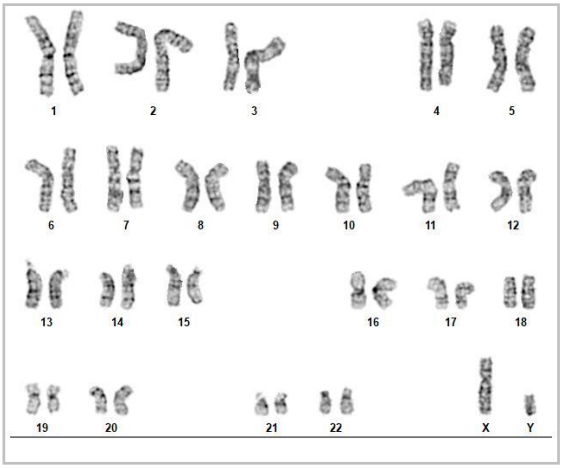
Chromosome Analysis Report: 094703

Date Reported: Tuesday, November 29, 2022
Cell Line: BU3 AG W308R
Submitted Passage #: P61
Date of Sample: 11/10/2022
Specimen: Human IPSC
Results: 46,XY

Cell Line Sex: Male
Reason for Testing: Karyotype analysis
Investigator: Marianne James, Boston University

Nonclonal findings: 47,XY,+Y



Cell: 68
Slide: G03
Slide Type: Karyotype

Total Counted: 40
Total Analyzed: 9
Total Karyogrammed: 5
Band Resolution: 350 - 425

Interpretation:

This is a normal karyotype; no clonal abnormalities were detected at the stated band level of resolution.

There is a nonclonal finding, listed above, which contains a chromosomal aberration (gain of chromosome Y) recurrently acquired in pluripotent stem cell cultures. An additional twenty cells were examined for this chromosomal aberration; it was not observed. Nonclonal findings may result from technical artifact, but may be due to a developing clonal abnormality or to low-level mosaicism.

Limitations: This assay allows for microscopic visualization of numerical and structural chromosome abnormalities. The size of structural abnormality that can be detected is >3-10Mb, dependent upon the G-band resolution obtained from this specimen. For the purposes of this report, band level is defined as the number of G-bands per haploid genome. It is documented here as "band level", i.e., the range of bands determined from the four karyograms in this assay. Detection of heterogeneity of clonal cell populations in this specimen (i.e.,mosaicism) is limited by the number of metaphase cells examined, documented here as "# of cells counted".
